

DATA & ANALYTICS

Salary Guide 2022

SALARY GUIDE INTRODUCTION

A WORD FROM THE CEO

It is my pleasure to introduce you to the latest edition of our annual US Data & Analytics Salary Guide.

While we have been running these guides globally for over a decade now, I am pleased to say that this latest edition is our most comprehensive yet, based on the input of over 9,000 respondents globally, more than ever before.

I want to thank every respondent who took the time to take part in our survey. Your responses have provided invaluable insights into how the industry looks from the inside and, alongside an analysis of our placements over the past year and a review of job boards worldwide, have offered a clear view of where the industry is in 2022. Despite talk of a "great resignation", we are now seeing more reluctance from candidates to move roles. While over 70% are either actively looking, or willing to move for the right opportunity, this is down from nearly 80% of respondents in 2020, albeit a similar number to what we found last year. This may well be a result of increase job security, with 92% of respondents reporting that they feel more, or as, secure in their role than they did this time last year.

A greater reluctance to move roles has, unsurprisingly, driven salaries up and, for the first time in several years uncompetitive salary is the most common reason for leaving a role. This may be a result of companies improving their career progression opportunities (the top reason for the past few years) but is also likely a result of "hiring salaries" beginning to stretch away from those offered to existing talent.

Progress does seem to have stalled somewhat when it comes to diversity. This year we found that only 26% of Data & Analytics professionals are women, which indicates a slight drop in numbers since last year. We'll examine this in more detail in our 2022 Diversity In Data Report, due to launch later this year, but this is somewhat surprising as we have seen numerous companies make deliberate efforts to improve their gender diversity.

For the meantime, this year's guide also offers a first insight into remote and hybrid-working patterns in a post-lockdown world. As you'll see, Flexible Working Hours and Remote Working Options remain two of the most desirable benefits in the industry, with most professionals only working on site 1-2 days a week. This is already having a significant impact on hiring trends and it will be interesting to see how this continues to evolve over the next few years.

I hope you find this year's guide useful and informative. As ever, if you have any feedback, suggestions or questions about the guide, then please email research@harnham.com.

ABOUT ______
DAVE FARMER

As one of the founding partners of Harnham, Dave has become a recognized figure in Data & Analytics recruitment over the past 16 years.

Having helped hundreds of Analytics professionals develop their careers, Dave is now leading and growing Harnham's presence throughout the UK, Europe and US.

ABOUT THIS GUIDE

For our 2022 Salary Guide, we have compiled data from:

Our independent survey completed by 9,484 respondents globally.

Analysis of all placements by Harnham US. Data from roles recruited by Harnham US.

Analysis of Data & Analytics roles advertised online.

Salaries for each role have been broken down by experience level and, for this year's guide, respondents were asked to match themselves against one of the following:

Entry Level (Starting out your Data & Analytics career in an entry-level role, perhaps having achieved your first promotion)*

Mid-Level (Experienced hands-on position, remaining in a technical capacity and possibly leading projects/teams)

Principal/Manager Level (Experienced hands-on position, remaining in a technical capacity but potentially in a management position)

Technical Lead/Director (Within a role that has moved from technical work and into a management position, or having a senior technical hands-on position)

VP and above (Leading business units comprising of one or more technical teams)

*Some entry-level salaries are not included for Contract roles due to the base level of experience required.

ABOUT THE ANALYSIS

The analysis for this report was conducted by Harnham's sister company, Rockborne. Below, Rockborne's CDO, Waseem Ali, discusses the process for this:

With Harnham's most recent industry survey garnering over 9,000 responses from professionals across the UK, US, and mainland Europe, the procedure established to yield insight from this data required data cleaning and exploration, both of which primarily occurred within Excel, PowerBI and Python.

As part of the data cleaning process, Rockborne used distribution analysis to identify outliers, which were removed as a result of some exploratory data analysis we conducted.

For the purposes of this study data outside of 'Male' and 'Female' was not considered due to the sparse number of responses, although we hope this changes over the coming years. Despite this, we will be looking at non-binary and gender fluid representation in Harnham's Diversity In Data report due out later this year, as we do not want this important area of discussion to be overloooked.

To compare different sectors within the data industry core disciplines were grouped into their respective specialisms, in order to provide a more tailored diagnosis whilst maintaining validity with the number of responses.

Rockborne are an expert provider of specialist Data & Analytics consultants. Recruiting regular cohorts of diverse, highly skilled and exceptionally promising STEM graduates, our expert trainers take these talented individuals through an intensive 16-week program of technical, business and consulting skills training, before placing them with leading data teams across all industry sectors.

REMOTE & **HYBRID WORKING**

After two years in and out of various restrictions, most companies who planned to return to the office have done so.

As anticipated, the majority of businesses have adopted hybridworking models, although only 10% have formalized these within contracts. Most professionals are therefore working within the parameters of non-contractual company policy or based on an informal agreement with their manager.

This has resulted in Data & Analytics professionals being in the office, on average, 1.5 days a week. For those in weekly, the true number is likely closer to 2.5 days a week, with some hybrid models only requiring in-office attendance once every couple of weeks.

As a result, companies looking to candidates to be in the office 4-5 days a week are finding it much harder to hire. The industry has embraced remote working and the flexibility that comes with it and candidates are wary that businesses who don't offer this have an inflexible culture.

That being said, many report that regular days in the office (within a hybrid model) is still useful for their professional advancement, suggesting that the visibility that comes with being on site does have its benefits.

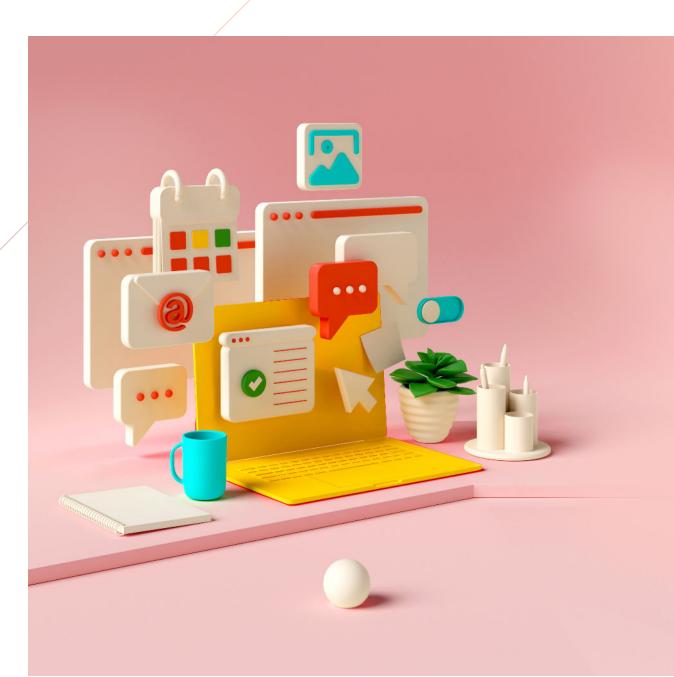

Remote and hybrid working has also transformed the hiring process. The ease of being able to complete interviews over zoom, or similar, and the resulting flexibility and agility this provides has reset candidate expectations of what an interview process should look like.

This has resulted in candidates expecting significantly shorter stretches between first interviews and offers being made. Indeed, many Hiring Managers are starting to find that candidates no longer have the patience for lengthy interview processes with numerous stages and tech tests and are seeing increasing numbers drop off if things go on too long.

ADVANCED ANALYTICS & INSIGHT USA

Advanced Analytics has continued to experience steady growth, particularly within start-ups which are striving to utilize data in a more strategic fashion.

Within e-commerce, for example, analytics is being leveraged from a predictive standpoint for consumer forecasting, targeting, personalization and effective marketing.

The market is constantly evolving, but the need for foundational skillsets is still very much at its core.

Consequently, foundational data hires are still highly sought after, particularly in smaller organizations, where they are relied upon to set out data strategy roadmaps and organize the data in order to be conducive for analytics.

OUR CONSULTANT'S THOUGHTS:

Hiring managers are looking for an equal blend of statistical prowess and presentation skills. Other sought-after attributes include a good tenure throughout their career and candidates who have seen analytical solutions through from start to finish - a skillset valued for entrepreneurial-based roles because of the ever-shifting climate.

On the other side of the coin, candidates are looking for modernized organizations from a tech stack perspective, who put Data & Analytics at the center of everything that they do.

Upward mobility is also a key seller, as are opportunities to work cross-functionally and without a ceiling to growth. This is key and enables staff to build skillsets that will allow them to take their career in numerous different directions.

COMPUTER VISION USA

The combination of innovation and the knock-on effects of COVID has made the use of Computer Vision far more prevalent across numerous industries.

This is particularly evident with the recent explosion of autonomous cars and self-driving vehicles. In fact, it is quickly becoming clear that this applies to any form of autonomous robotics, for example in packing and shipping in warehouses.

This has led to the continuation of a candidate driven market, and despite there being plenty of top talent out there, the imbalance between supply and demand is forcing companies to be extremely competitive. Roles within image recognition, 2D and 3D perception and SLAM (Simultaneous Localization and Mapping) are experiencing a particular uptick.

OUR CONSULTANT'S THOUGHTS:

Hiring managers are now seeking candidates with a minimum of a master's degree specifically in computer science, computer vision or robotics. Fortunately, this demand is being answered by US technology schools offering computer vision and robotics-specific programs.

A wide range of applications is one of the reasons that Computer Vision is experiencing so much interest. Candidates are eager to beat the forefront of cutting-edge innovation and to take opportunities where they can make a real impact - something that often lends itself to start-up environments.

DATA & TECHNOLOGY USA

The market has experienced a lot of growth over the last 12 months, and while it has aways been a competitive space, it has become increasingly more so over recent years.

One clear trend is the growing need for Data Engineers to build the infrastructure and tools that allow for the creation of clean data for analysis. Other roles including Data Infrastructure Engineering and DevOps Engineering are also becoming more popular.

This stems from the fact that companies are increasingly linking their Data Engineering and Machine Learning processes, using several different cross-functional skill sets. They are largely focusing on building tools for machine learning, and sourcing engineers able to effectively pull high quantities of data from multiple sources.

OUR CONSULTANT'S THOUGHTS:

DATA & ANALYTICS

Salary Guide 2022

As ever, Hiring Managers are looking for those with a good combination of soft skills and strong technical expertise. In smaller businesses in particular, these roles involve interfacing across multiple departments to glean the necessary information and insights. Those with broad, but deep experience are particularly highly desired but very hard to come by.

Employees are under huge amounts of pressure to stay up to date and relevant and will move regularly if their company isn't innovating quickly enough, to avoid their market value plummeting.

DATA SCIENCE USA

Data Science has continued to evolve heavily over the past 12 months, with newer spaces that were on the cusp of breaking through this time last year now firmly placed on the map.

An example of this is Machine Learning Operations (MLOps), an intersection between Data Science and Data Technology which combines a host of skillsets and processes such as modeling, Machine Learning, infrastructure and platform. The merging of these verticals has created a very niche area which, in turn, has created a job role that is harder to recruit for.

Hiring managers are looking for candidates who hold five to six years of experience – self-starters who do not necessarily need a lot of hand holding. Nevertheless, being such a broad area, it's hard to come by people with the exact experience required.

This means digging a lot deeper into a candidate's profile than usual. Titles tend to be subjective in data science, so we need to look at what existing skills they already hold (Python remains to be a must-have amongst most employers), the roles and responsibilities they have already undertaken as well as transferrable skills and an aptitude for learning.

Away from MLOps and more generally within Data Science, the needs of hiring managers have also shifted in 12 months. Because of the economic climate that the US currently faces, both employers and candidates have become far more cautious in their recruitment efforts than before. Now, they want to find a person or people who fit seamlessly within the team culturally, that showcase a good level of commitment to the company – even in the initial interview stages – as well as effective soft skills, such as the ability to communicate well with stakeholders.

DIGITÁL ANALYTICS USA

There have a few notable drivers behind growth in the Digital Analytics market this year.

Despite existing for a while now, Google Analytics 4 (GA4) is experiencing increased visibility and as a result, companies are hiring candidates specifically to carry out the migration and implementation of the platform.

The shifting privacy landscape and increased regulations are driving demand for talent who can facilitate ethical user tracking, and companies are becoming even more usercentric in their approach which is bolstering roles in website and conversion rate optimization.

On the media analytics side, demand for those who can analyze media campaign performances within an agency environment, is consistently high. We are particularly seeing more client-side roles within media analytics, as brands shift towards building those teams internally.

OUR CONSULTANT'S THOUGHTS:

The impact of a highly fluid job market is causing hiring managers to place a greater emphasis on sourcing candidates that can demonstrate longevity in their roles.

There's also a heavy emphasis on communication. Companies need candidates to build relationships with senior level stakeholders, as well as working on an autonomous basis without much hand holding - a skill which has gained more traction as a result of remote working.

Candidates are in search of growth, culture, good leadership and flexible working in their roles. Due to the job heavy market, it is incredibly rare that a candidate will take a lateral move, not only in salary but in terms of seniority and responsibility - they want to take on roles that they can grow into.

LIFE SCIENCE ANALYTICS USA

It has been challenging year for biotech, but traditional BioPharm companies are continuing to prosper.

Companies are discovering the potential impact of the insights that can be gleaned from data with the right talent.

Jobs in Artificial Intelligence (AI) and Machine Learning (ML) are surging, and while there will always be space for biotech analytics, there is now an increased focus on those with cutting edge ML experience. The trends that you see in finance for example are being applied to biological problems. Hiring managers are seeking ML scientists and engineers that have biology and healthcare knowhow.

OUR CONSULTANT'S THOUGHTS:

There's been an uptick in those from engineering looking to shift into the sector and an increased need for strong infrastructure to facilitate the vast swathes of data at hand, so those with experience with the cloud and integrating old servers are of increasing value.

Hiring managers need candidates who can translate between different roles. Biotech firms are always competing against the high salaries of big tech firms in order to secure ML engineers and as a result, they are on the lookout for those who are more mission driven, and intellectually curious.

There is a mismatch in demand, as employers seek those with comprehensive experience, particularly in the start-up market, while candidates are looking for opportunities to learn and grow dynamic skillsets.

RISK ANALYTICS USA

Credit Risk is currently the biggest growth market in this space and is driving a huge surge in demand for Credit Fisk professionals - of which, there isn't a huge pool.

Because much of what is involved in understanding fraud or risk is understanding customer behaviour, candidates are being plucked from traditional customer analytics roles.

As a result, Customer Analytics is now blending into Credit Risk and rather than being kept as a separate independent function, Credit Risk now often sits with product teams or Data Science teams. The titles that are emerging highlight this blend, such as Credit Risk Data Scientist or Product Manager (Credit Risk).

OUR CONSULTANT'S THOUGHTS:

For candidates it's all about growth in role. Typically Credit Risk was a relatively siloed area, but candidates no longer want to limit their career by working within purely one area of Credit Risk. They want to learn and be challenged and therefore tend to favor fast-paced start-ups over slower moving hierarchal big firms.

OFFERED A PERMANENT POSITION AT THE END OF THEIR CONTRACT

Only 40% percent accepted, and 36% of these saw their pay decrease as a result.

HARNHAM CONTRACT

Following a burst of hiring following COVID in the resurgence of office working, the markets remained steady last year.

With that surge in demand, many companies moving to Contract to Hire models, particularly for remote workers.

Lately, small breaks in the market are beginning to appear. An inflection point had been hit where companies were receiving significant investments, but now with rising interest rates, CFOs are looking to pump the breaks and be smarter about how they're investing their money. Profitable companies are still chugging along, but others have had to go through some corrections, which is natural in this market.

There is likely to be a small uptick in the percentage of roles that are contracted over the next six months, as those conscious of budgets look to keep their full-time head count low and wait to see what happens with the economy.

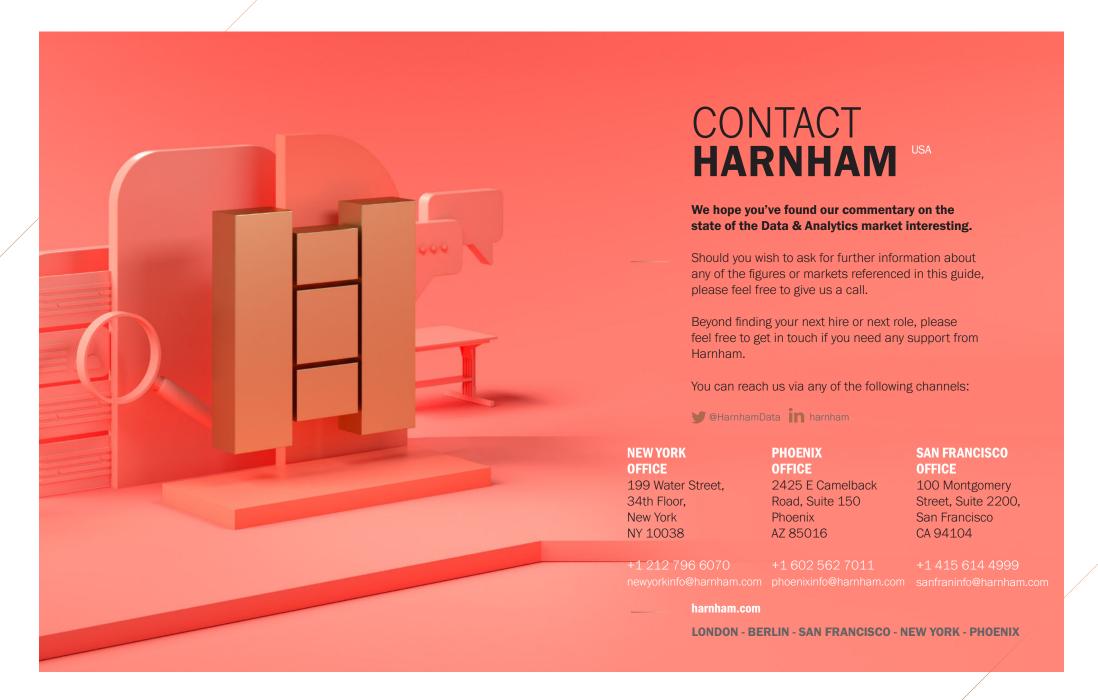

For Hiring Managers, communication skills are paramount in contracted roles, as well as a preference for those with a background aligned with the company, whether that be a start-up or streaming company.

On the candidate side, there will always be gravitation towards companies which use newer data tools and who are up to speed with Data Warehousing for example.
